

Lecture 4

Requirements

Matthew Farah

March 2, 2026

- Design is best defined as the process of embedding some function into a form.
- The form a design takes should be:
 1. Dependable.
 2. Sustainable.
 3. 'Harmonious' with its environment
- Functional requirements describe the functionality of the design.
 - Describes the design's reason for existence.
- Non-functional requirements describe the form that design should take.
 - Describes how the design should be manifested or instantiated
- Non-functional requirements can put specific requirements on the design's speed, security, ease-of-use, and so on.
- The environment and functional requirements of a design place constraints on its implementation.
